Our expertise in healthcare specific workflows, processes, systems and technologies ensures faster ramp-up and understanding of domain-intensive requirements. We have worked with companies committed to building value-led software product offerings for providers, hospitals and networks.

The Healthcare industry is faced with challenges including increased government regulations, higher patient expectations, using information technology to lower health care costs and emerging technologies that can enhance access of information anytime, anywhere and on any device. These challenges have driven healthcare organizations to expand their development efforts without compromising mission critical tasks, while having to maintain current systems. Everest helps healthcare organizations manage these challenges by offering expert application development, application maintenance and testing/QA services.

Our work on multiple healthcare projects over the years has further developed our extensive healthcare domain knowledge and familiarity. Our knowledge in collaborative health toolsets and applications, coupled with our healthcare familiarity allows us to help you meet today's challenges and prepare for the future.

Software Services

- Custom Development in .NET and Java for Web and Client/Server Models
- Web and Mobility Enabling Legacy Systems
- Forms and Workflow Process Implementation
- Data-warehousing, Business Intelligence and Key Performance Indicators
- Quality Assurance, Validation and Verification Testing
